## SEARCH REQUEST FORM

Scientific and Technical Information Center

Requester's Full Name: DAWN GARRETT Examiner #: 76107 Date: June 24, 2004  
Art Unit: 1774 Phone Number: 272-1523 Serial Number: 10/786, 812  
Mail Box and Bldg/Room Location: Remsen 5C75 Results Format Preferred (circle): PAPER DISK E-MAIL

If more than one search is submitted, please prioritize searches in order of need.

\*\*\*\*\*

Please provide a detailed statement of the search topic, and describe as specifically as possible the subject matter to be searched. Include the elected species or structures, keywords, synonyms, acronyms, and registry numbers, and combine with the concept or utility of the invention. Define any terms that may have a special meaning. Give examples or relevant citations, authors, etc, if known. Please attach a copy of the cover sheet, pertinent claims, and abstract.

Title of Invention: Electroluminescent Device Having Pendant  
Naphthylanthracene-based Polymers  
Inventors (please provide full names): Shiyong Zheng, Kathleen Vaeth  
Earliest Priority Filing Date: 2/25/2004

\*For Sequence Searches Only\* Please include all pertinent information (parent, child, divisional, or issued patent numbers) along with the appropriate serial number.

Please search the polymer described by the structure  
in claim 1.

Thank you! 6

\*\*\*\*\*

GI

I

- AB An organic **electroluminescent** polymer is described having a main chain consisting of 9,10-diphenylanthracene and vinylene units represented by the general formula I wherein, Ar1, Ar3 = an arylene group with none, alkyl (R1-), or alkoxy (RO-) substitute; an 10-24 atom arylene group having fused aromatic ring; an arylene group with an R1 amino substitution or an aryl(Ph-) amino group; a carbazole derivative having an R1- or a Ph-group; a fluorenylene group having, at position 9, an R1- group, a polyalkoxide (C1-C25) group, or an R1- or RO- substituted aryl group; a silylene group substituted with R1-, RO- or Ph- group; and an arylene (or aryl for Ar2 and R) group having a silyl group having an R1-, RO-, Ph-group; and (Ar2, R) maybe the same chains as in Ar1 or Ar3 or H-, cyano or fluoro group; wherein the size of R1- or RO- chain is C1-C25 and Ph- is C6-C30 unless specified otherwise, 1 = 1-100,000, m = 0-50,000, (1 ≥ m); and n = 1-100,000. An organic **electroluminescent** device using the **electroluminescent** polymer is also described.

138:212611 **Electroluminescent** devices having diarylanthracene ladder polymers in emissive layers. Zheng, Shiyang; Shi, Jianmin (Eastman Kodak Company, USA). Eur. Pat. Appl. EP 1289029 A2 20030305, 43 pp. DESIGNATED STATES: R: AT, BE, CH, DE, DK, ES, FR, GB, GR, IT, LI, LU, NL, SE, MC, PT, IE, SI, LT, LV, FI, RO, MK, CY, AL, TR, BG, CZ, EE, SK. (English). CODEN: EPXXDW. APPLICATION: EP 2002-78394 20020816. PRIORITY: US 2001-941009 20010828.

GI

AB Organic **light-emitting** diodes comprising an **anode**, a **cathode** and an emissive layer disposed between the **anode** and **cathode** are described in which the emissive layer includes a polymer having repeating units described by the general formula I ( $0 \leq x < 1$ ;  $0 < y \leq 1$ ;  $x + y = 1$ ; S and T = independently selected chemical bonds, oxygen atoms, sulfur atoms, C-R, or N-R; R = H, C1-24 alkyl, C6-28 (un)substituted aryl, C4-40 (un)substituted heteroaryl, CN, nitro, Cl, Br, or F; in each ring including D and E, if either D or E is a single bond, then the other group is not a single bond and is R-C-R where R is a substituent; Ar1, Ar2, and Ar = independently selected C6-40 (un)substituted aryl; or Ar1, Ar2, and Ar = independently selected C4-40 (un)substituted heteroaryl). The emissive layer may be doped.

128:13471 A Novel, Bright Blue **Electroluminescent** Polymer: A  
Diphenylanthracene Derivative. Kim, Yunhi; Kwon, Sunki; Yoo, Dongsik;  
Rubner, Michael F.; Wrighton, Mark S. (Departments of Chemistry and

Materials Science and Engineering, Massachusetts Institute of Technology, Cambridge, MA, 02139, USA). Chemistry of Materials, 9(12), 2699-2701 (English) 1997. CODEN: CMATEX. ISSN: 0897-4756. Publisher: American Chemical Society.

- AB A blue **electroluminescent** polymer containing 9,10-diphenylanthracenevinylene phenylene and alkylene block in the main chain was prepared by the Wittig reaction. The polymer structure was characterized by elemental anal., IR, <sup>1</sup>H NMR, and <sup>13</sup>C NMR. High photoluminescence quantum yields, up to 0.88 ± 10% in solution and 0.32 ± 10% in the solid state, have been measured for this polymer. **Electroluminescent** devices were made with a single layer of the polymer using ITO as the **anode** and Al as the **cathode**. A bluish white luminescence from this single layered device has been obtained with intensities in the range of 45-80 cd/m<sup>2</sup> and external quantum efficiency of 0.01%.

127:35249 **Electroluminescence** from New Polynorbornenes That Contain Blue-Light-Emitting and Charge-Transport Side Chains.

Boyd, Thomas J.; Geerts, Yves; Lee, Jin-Kyu; Fogg, Deryn E.; Lavoie, Gino G.; Schrock, Richard R.; Rubner, Michael F. (Department of Chemistry, Massachusetts Institute of Technology, Cambridge, MA, 02139, USA). *Macromolecules*, 30(12), 3553-3559 (English) 1997. CODEN: MAMOBX. ISSN: 0024-9297. Publisher: American Chemical Society.

AB A blue-light-emitting electroluminescent

polymer was prepared by ring-opening metathesis polymerization (ROMP) of a norbornene monomer that contains a diphenylanthracene chromophore as a side chain ( $\lambda_{\text{max,em}} = 450 \text{ nm}$ ). Norbornene monomers also were synthesized that contain an oxadiazole (for electron transport) or a tertiary arylamine (for hole transport). Oligomers (25mers or 50mers) of homo- and copolymers ( $M_w/M_n = 1.02-1.08$ ) were prepared in toluene in 95-98% yield, employing  $\text{Mo}(\text{N}-2,6-\text{C}_6\text{H}_3-\text{i-Pr}_2)(\text{CHMe}_2\text{Ph})(\text{O}-t\text{-Bu})_2$  as the initiator. **Electroluminescent** devices made with a single layer of substituted polynorbornene, an ITO **anode**, and an Al **cathode** were prepared first. Two-layer devices were then constructed in which the

substituted polynorbornene was spin cast onto a 25-bilayer poly(phenylenevinylene) (PPV) heterostructure. The two-layer device performed best in terms of efficiency, light output, and threshold voltage.

- AB Blends of poly(N-vinylcarbazole) (I) with a new polyester having the structure II and 2-(4-biphenyl)-5-(4-tert-butylphenyl)-1,3,4-oxadiazole at various weight ratios were used as the emitter in unilayer **electroluminescence (EL)** devices with an indium cathode. Analyses of fluorescence and **EL** spectra implied common emission energy states are formed in the blend films, which explains the possibility of maximum **EL** efficiency in blend films higher than that in either I and II. The photoluminescence (PL) and **EL** spectra show the maximum emission band red shifts slightly between 430 nm and 450 nm as the ratio of II increases, while the half width increases and a new peak around 525 nm appears. The new peak originates from the dimer formed by coupling of interchains in II. Both II and I can give rise to PL **emission** under UV **light**. The origin of PL and **EL** emission is analyzed.

138:345657 Chemiluminescent properties of polyurethane fluorophores containing red and blue chromophore moieties. Kim, Dae-Wook; Lee, Chil-Won; Joo, Sang-Woo; Gong, Myoung-Seon (Department of Chemistry, Dankook University, Chung-nam, 330-714, S. Korea). Journal of Luminescence, 99(3), 205-212 (English) 2002. CODEN: JLUMA8. ISSN: 0022-2313. Publisher: Elsevier Science B.V..

AB Polyurethane copolymer fluorophores-containing perylene tetracarboxylic diimide and di-Ph anthracene units were prepared to examine the chemiluminescent properties. The UV-visible spectrophotometric, photoluminescent and chemiluminescent characteristics were studied for the monomeric and polymeric fluorophores. The Na salicylate-catalyzed reaction of bis(2-carbopentyloxy-3,5,6-trichlorophenyl)oxalate with H<sub>2</sub>O<sub>2</sub> provided a strong chemiluminescent **light emission** from red to blue color according to the mixing ratio of 2 chromophore units as analogous to the photoluminescent spectra. Although the chemiluminescent intensity was found to decay biexponentially as a function of measuring time, the chemiluminescent glow lasted for >24 h and was visible with the naked eye.

137:338326 Synthesis and characterization of novel ladder polymer containing diphenylanthracene. Zheng, Shiyang; Shi, Jianmin (Research and Development, Eastman Kodak Company, Rochester, NY, 14650, USA). Polymer Preprints (American Chemical Society, Division of Polymer Chemistry), 43(2), 599-600 (English) 2002. CODEN: ACPPAY. ISSN: 0032-3934. Publisher: American Chemical Society, Division of Polymer Chemistry.

AB Novel ladder polymers containing highly fluorescent 9,10-diphenylanthracene were designed and synthesized. The polymer was prepared by a soluble precursor route, and was soluble in organic solvents. The structure was confirmed by NMR anal. The polymer showed a high thermal decomposition temperature and no Tg due to

the rigid nature of the ladder structure. The polymers exhibited intense green photoluminescence in solution and the solid state. The unique structure and optical property make it a potential candidate for electronic applications such as **light emitting** diodes.

L71 ANSWER 8 OF 19 HCA COPYRIGHT 2004 ACS on STN

137:325854 Chemiluminescent properties of polymeric blue fluorophores containing diphenylanthracene unit. Park, Hoon-Young; Geum, Neri; Ko, Jaehung; Gong, Myoung-Seon (Department of Chemistry, Dankook University, Cheonan, Chungnam, 330-714, S. Korea). Dyes and Pigments, 54(1), 59-66 (English) 2002. CODEN: DYPIDX. ISSN: 0143-7208. Publisher: Elsevier Science Ltd..

AB New conjugated and non-conjugated alternating block copolymers containing 9,10-diphenyl-2-chloroanthracene moieties in the main chain were synthesized via Williamson synthesis for the blue chemiluminescent fluorophore. UV-vis absorption and luminescent characteristics including chemiluminescence were measured and compared with model fluorophore 9,10-bis(p-methoxyphenyl)-2-chloroanthracene. Polymers displayed blue photoluminescence in solution with maximum around 430 nm. Tetra-Me ammonium salicylate-catalyzed reaction of hydrogen peroxide with bis(2-carbopentyloxy-3,5,6-trichlorophenyl)oxalate produced a strong chemiluminescent blue **light emission** with wavelength of 440 nm in the presence of the polymeric fluorophore. The chemiluminescent intensity decayed exponentially and the glow of chemiluminescence maintained more than 12 h and was visible with naked eye.

136:370223 Chemiluminescent properties of copolyesters containing red and blue chromophores. Lee, Chil-Won; Joo, Sang-Woo; Ko, Jaejung; Kim, Jong-Seung; Lee, Shim-Sung; Gong, Myoung-Seon (Department of Chemistry, Dankook University, Cheonan, Chungnam, 330-714, S. Korea). Synthetic Metals, 126(1), 97-104 (English) 2002. CODEN: SYMEDZ. ISSN: 0379-6779. Publisher: Elsevier Science S.A..

AB Polyester fluorophores containing red and blue **light-emitting** chromophore units were prepared by copolycondensation of perylene tetracarboxydiimide and di-Ph anthracene derivative with sebacoyl chloride for the chemiluminescence. The properties of fluorophore polymers were studied by UV-Vis spectrophotometric, photoluminescent and chemiluminescent investigation. The intensities of UV-Vis absorbance, photoluminescence and chemiluminescence spectra appeared to systematically increase as the content of two monomers. The sodium salicylate-catalyzed reaction of bis(2-carbopentyloxy-3,5,6-trichlorophenyl)oxalate with hydrogen peroxide provided a strong chemiluminescent light changing from red to blue according to the content of two chromophore units; these were similar to the photoluminescent spectra. The chemiluminescent intensity was decayed biexponentially, but the glow of chemiluminescence maintained more than 24 h and was visible with the naked eye.

L71 ANSWER 12 OF 19 HCA COPYRIGHT 2004 ACS on STN  
 136:103028 Charge carrier transport in aromatic polyimides and  
 polyimide/J-aggregate composites. Tameev, Alek R.; Kozlov, Aleksey A.;  
 Mal'tsev, Eugene I.; Lypenko, Dmitry A.; Bobonkin, Vladimir V.; Vannikov,  
 Anatoly V. (Frumkin Institute of Electrochemistry of the Russian Academy  
 of Sciences, Moscow, 117071, Russia). Proceedings of SPIE-The  
 International Society for Optical Engineering, 4105(Organic Light-Emitting

Materials and Devices IV), 443-449 (English) 2001. CODEN: PSISDG. ISSN: 0277-786X. Publisher: SPIE-The International Society for Optical Engineering.

AB Charge carrier transport in aromatic polyimides based on 9,10-bis(aminophenyl)anthracene or 9,10-bis(phenylthio)anthracene and their composites with dye J-aggregates was studied using conventional time-of-flight techniques. The elec. field and temperature dependencies of both

hole and electron drift mobility were observed. In amorphous films of the soluble polyimide, the drift mobility was found to reach the value of  $10^{-4}$  cm<sup>2</sup> V<sup>-1</sup> s<sup>-1</sup>. In films of the insol. polyimide containing a crystalline phase, the

mobility was lower by one or two orders of magnitude. The result is attributed to the presence of cavities in the crystalline film. The applicability of known theor. models describing the temperature and elec. field dependencies of mobility is discussed. J-aggregates, formed in the soluble polyimides doped with cyanine dye mols., play an active role in charge carrier transport in the **electroluminescence** composites.

Publisher: SPIE-The International Society for Optical Engineering.
- AB The **electroluminescence (EL)** of donor-acceptor polyimides prepared from 9,10-bis(m-aminophenylthio)-anthracene (BPTA) and 1,3-bis(3,4-dicarboxyphenoxy)benzene or 2,2-bis[4-(3,4-dicarboxyphenoxy)phenyl]-propane dianhydrides was studied. The aromatic polyimides with and without sulfur atoms in the backbone, were evaluated as electron-hole transporting and **light-emitting** materials for use in single- and multilayer **electroluminescent** diodes. These polyimides are efficient electron and hole conductors and

also exhibit intense photoluminescence of exciplex origin. Some of the polyimides have been used as hole conducting layers with tris(8-quinolinolato)aluminum complex (Alq3) as electron conducting layer in bilayer LEDs of high brightness. A direct correlation was revealed between transport characteristics and **electroluminescent** properties of these electroactive materials. At room temperature, the electron mobility and hole drift mobility directly measured by conventional TOF techniques indicate effective bipolar transport. The simplicity of synthesis, high thermal stability, organic solvent solubility, and excellent film-forming ability make these polyimides good candidates for technol. applications. The band structure, bipolar transport, and electron donor-acceptor interactions in test one-layer and bilayer LEDs based on the polyimides are described.

L71 ANSWER 15 OF 19 HCA COPYRIGHT 2004 ACS on STN  
132:12558 Soluble rigid-flexible polyethers containing bis(biphenyl)anthracene or bis(styryl)anthracene units in the main chain for **light-emitting** applications. Konstandakopoyloy, Fotini D.; Kallitsis, Jannis K. (Department of Chemistry, University of Patras, Patras, GR 265 00, Greece). Journal of Polymer Science, Part A: Polymer Chemistry, 37(20), 3826-3837 (English) 1999. CODEN: JPACEC. ISSN: 0887-624X. Publisher: John Wiley & Sons, Inc..

AB New rigid-flexible polyethers containing bis(biphenyl)anthracene or bis(styryl)anthracene units in the main chain were synthesized and characterized by viscometry, thermal and mech. anal., NMR, UV-vis, and luminescence spectroscopy. The polyethers containing bis(styryl)anthracene units in the main chain form free-standing films either from solution casting or after melt pressing at temps. where they are thermally stable. The length of the flexible spacer influences the thermal and mech. behavior of these polymers. The isotropization temperature as well as the glass transition temperature show an odd-even effect depending on the spacer segment length. Films with high modulus at room temperature and glass transition temps. in the range 74-103°C were obtained using dynamic mech. anal. These

polymers show bright-yellow photoluminescence with maximum at 580 nm in solution

In the solid state, the luminescence maximum is either red or blue shifted depending on the number of the methylene units in the aliphatic segment. The polyethers containing bis(biphenyl)anthracene units in the main chain are blue-light-emitting polymers with photoluminescence maxima at 435 and 455 nm in solution

L71 ANSWER 16 OF 19 HCA COPYRIGHT 2004 ACS on STN

128:283220 Luminescence properties of PPV derivatives carrying anthracene pendent groups. Jin, Jung Il; Chung, Sung Jae; Yu, Seong Han (Department Chemistry Advanced Materials, Chemistry Research Center, Korea University, Seoul, 136701, S. Korea). Macromolecular Symposia, 128 (International Symposium on New Approaches in Polymer Synthesis and Macromolecular Formation, 1997), 79-87 (English) 1998. CODEN: MSYMEC. ISSN: 1022-1360. Publisher: Huethig & Wepf Verlag.

AB The photo- (PL) and **electroluminescence (EL)** properties of 3 different PPV derivs. carrying the 9,10-diphenylanthracene units are compared. One (P1) of the polymers contains the 9,10-diphenylanthracene structure as an integral part of the main chain, but the other two have it as the pendent group attached to the main chain through either oxyethyleneoxy (P2) or oxyhexamethyleneoxy (P3) spacer. P1 and P2 exhibit very similar PL and **EL** spectra that are more or less of superimposed feature of the spectra from the backbones and the anthracene pendants. In contrast, P3 shows an **EL** spectrum that is completely different from its PL spectrum. Whereas the PL spectrum of P3 appears to be a combination of the spectra from the main chain and the pendants, as for P1 and P2, the **EL** spectrum of P3, however, looks as if the **lights** were **emitted** only from the backbone. This difference is explained in terms of excited state electronic interactions between the main chain and the pendants.

127:136117 Novel PPV derivatives **emitting light** over a

broad wavelength range. Chung, Sung Ja; Jin, Jung Il; Kim, Kong Kyum

(Research Center, Korea Univ., Seoul, 136, S. Korea). Advanced Materials (Weinheim, Germany), 9(7), 551-554 (English) 1997. CODEN: ADVMEW. ISSN: 0935-9648. Publisher: Wiley-VCH.

AB An approach to design organic **light-emitting** devices that emit over a broad spectral range, i.e., essentially white light is shown. The preparation of 2 polymers films consisting of substituted poly(p-phenylenevinylene) (PPV) is described, together with the results of absorption, photoluminescence (PL), **electroluminescence** (EL) measurements. One polymer carries phenylanthracene moieties directly attached to the phenylene rings in PPV, whereas in the other polymer 9,10-diphenylanthracene moieties are bound through hexamethylene spacers to the phenylene rings in the main chain. Direct attachment of anthracene to the PPV main chain results in nearly the same PL and EL behavior, whereas insertion of a hexamethylene spacer produces markedly different PL and EL properties.

124:177450 Synthesis and spectral-luminescence properties of aromatic polyamides and polyesters with chromophores in the polymer main chain. Barashkov, N. N.; Novikova, T. S.; Guerrero, D. J.; Ferraris, J. P. (Department of Chemistry, The University of Texas at Dallas, PO Box 830688, Richardson, TX, 75083-0688, USA). Synthetic Metals, 75(3), 241-7 (English) 1995. CODEN: SYMEDZ. ISSN: 0379-6779. Publisher: Elsevier.

AB We report polycondensation reactions of several benzimidazole-, benzoxazole- and diphenylanthracenyl-containing chromophores with m-phenylenediamine (MPD), isophthaloyl chloride (IPC) and bisphenol A (BPA) to form polyamides and polyesters. The absorbance and fluorescence spectra of the polymers were measured and the actual molar ratios of luminophoric and nonluminophoric moieties in their structures were determined by comparison to model compds. Most copolymers showed intense blue fluorescence, from solution and film, with a maximum in the 410-515 nm range. Non-conjugated luminescent polymers, which are potentially useful for **light-emitting** diode applications, may be obtained by a one-stage copolycondensation technique.

126:104659 Photoinduced Electron Transfer at the Core/Shell Interface of Polystyrene-Anthracene-Poly(methacrylic acid) Diblock Copolymer Micelles in Aqueous Media. Eckert, A. R.; Martin, T. J.; Webber, S. E. (Department of Chemistry and Biochemistry and Center for Polymer Research, The University of Texas at Austin, Austin, TX, 78712, USA). Journal of Physical Chemistry A, 101(9), 1646-1656 (English) 1997. CODEN: JPCAFH. ISSN: 1089-5639. Publisher: American Chemical Society.

AB We have characterized the photophysics and excited-state electron transfer reactions of polymer micelles formed from diblock polystyrene-(anthracene)-block-poly(methacrylic acid). In these studies (anthracene) comprises either a single 1-(2-anthryl)-1-phenylethylene (An) or an average of two vinyl-9,10-diphenylanthracene (vDPA). This architecture is expected to place the chromophores in the interfacial region between the polystyrene core and poly(methacrylic acid) corona. Quenching of the anthryl fluorescence by Tl<sup>+</sup> and two viologens (SPV, 4,4'-bipyridyl-1,1'-bis(propanesulfonate), and MV2<sup>+</sup>, Me viologen) demonstrated that access to these chromophores was limited at all pHs, and the rate of diffusion of the viologens was relatively slow. Similar conclusions were drawn from quenching of the 3An\* state and the anion radical SPV<sup>•-</sup> by O<sub>2</sub>. We believe this illustrates that the interfacial region of the micelle is not fully deprotonated even at pH 9. It was observed that the fraction of 3An\* that was quenched by SPV was smaller than 1An\*. This demonstrates the existence of a heterogeneous distribution of anthryl sites such that some 3An\* cannot be quenched, which is not the case for 1An\*. We conclude that the spatial requirements for quenching these two excited states are not equivalent. Electron transfer quenching by SPV produces SPV<sup>•-</sup> that is very long-lived, but some unknown reaction removes the anthryl cation radical. As a consequence, we can build up a concentration of SPV<sup>•-</sup> under steady-state photolysis. The quantum yield of charge separation per quenching event is similar to previous cases we have studied, ca. 0.5, but unlike linear polyacids, there is very little pH dependence. This is consistent with the idea that there is minimal deprotonation near the core-corona interface of the micelle.

L59 ANSWER 5 OF 20 HCA COPYRIGHT 2004 ACS on STN

109:7285 Photophysics of block copolymers of 2-vinylnaphthalene and vinylidiphenylanthracene: unidirectional energy transfer. Sowash, Geoffry G.; Webber, S. E. (Cent. Polym. Res., Univ. Texas, Austin, TX, 78712, USA). Macromolecules, 21(6), 1608-11 (English) 1988. CODEN: MAMOBX. ISSN: 0024-9297.

AB Sensitization of the diphenylanthracene (I) singlet state in the title block copolymer by that of the naphthalene moiety is very efficient in THF solns. The quantum efficiency of sensitization as measured by steady-state **fluorescence** spectroscopy is higher than that based on lifetime shortening. This implies that some sensitization occurs very quickly (e.g., "contacts" between donor and acceptor) or that a nonemitting precursor state of the observed naphthalene singlet can sensitize I. By virtue of the block nature of this copolymer energy migration is unidirectional, i.e., from one block to another.

102:167476 Water-soluble photon-harvesting polymers: intracoil energy transfer in anthryl- and **fluorescein**-tagged poly(vinylpyrrolidinone). Hargreaves, John S.; Webber, Stephen E. (Dep. Chem., Univ. Texas, Austin, TX, 78712, USA). *Macromolecules*, 18(4), 734-40 (English) 1985. CODEN: MAMOBX. ISSN: 0024-9297.
- AB A copolymer [95070-20-5] soluble in polar solvents (e.g., MeOH, H2O) was prepared from 1-vinyl-2-pyrrolidinone 44, 9-phenyl-10-(4-vinylphenyl)anthracene (I) 0.42, and the thiourea from acrylamide and **fluorescein** isocyanate (II) 0.42 mmol. Absorption of light by I resulted in efficient intracoil sensitization of the 1st excited state of II. The quantum efficiency of this process was 0.4 in MeOH and 0.8 in H2O, corresponding to a smaller coil size in H2O. The **fluorescence** decay showed intracoil energy transfer to be essentially static, and that anthryl aggregation can result in nonexponential decay, interpreted as a dynamic equilibrium between the 1st excited state of I and a nonfluorescent dimer state. **Fluorescence** quenching showed the polymers to be inhomogeneous, self-organizing into hydrophobic and hydrophilic regions.
